

Basement and Crawl Space Waterproofing

Waterproofing is a once in a lifetime investment, and it's an important one. Why? Because water in your basement or crawl space eventually reaches your foundation, which can cause damage like this.

Moisture Loc's Basement and Crawl Space Waterproofing solutions keep your foundation safe from water damage. Here's how. First, our water intrusion experts determine which waterproofing solution best fits your needs:

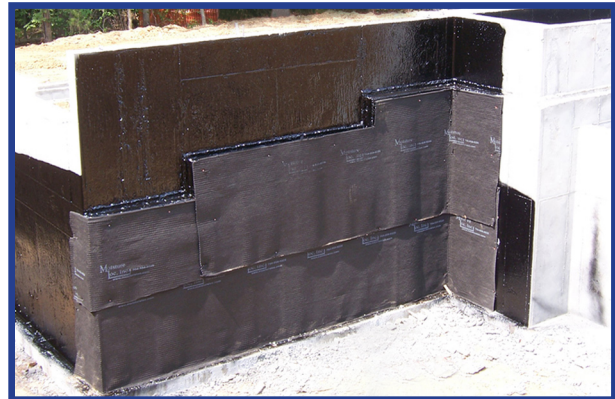

- **Exterior Waterproofing** – Stops water from ever entering your basement or crawl space.
- **Interior Panel System** – Moves water that collects in your basement or crawl space away from your foundation.

Our highly-trained installers then use industry leading products to install the waterproofing solution that is right for your home. Let's take a closer look at Moisture Loc's waterproofing solutions.

Exterior Waterproofing

Exterior Waterproofing locks moisture away from your basement or crawl space, making it the perfect solution for homes under construction, and for existing homes that have exterior access to below grade walls.

Our **Exterior Waterproofing** solution uses a heated asphalt emulsion that stops water from ever getting in. The emulsion is sprayed onto exterior walls, then covered with wall drain board.

This industrial grade emulsion is designed specifically for below grade application, and contracts and expands as weather conditions change, protecting your home even in extreme heat and cold.

If needed, our trained installers excavate around your foundation, seal cracks in walls, seal pipe penetrations, and install footing drains.

Moisture Loc completes each job by covering any exposed water barriers with dirt, then installing drains to move water safely away from your foundation.

Interior Panel System In existing homes, it may not be possible to access the outside walls of your basement or crawl space. Moisture Loc then installs an **Interior Panel System** as a waterproofing solution. First, installers dig a trench along the inside of an existing wall to collect water.

Next, a drain (and possibly a sump pump) is installed to move that water away from your foundation.

An antimicrobial panel is then attached to the wall. This panel collects water as it seeps through the wall, then directs that water into the trench below, which then carries the water away from your foundation via the drain. This panel is made of an inorganic material that will not grow mold or mildew.

Moisture Loc completes your **Interior Panel System** by pouring concrete to restore your basement or crawl space floor to its original condition.

Why Moisture Loc?

All of our completed installations undergo a quality inspection by an operations manager who is a highly trained water intrusion and foundation expert. That's because at Moisture Loc we make sure we get every job done right.

Moisture Loc's installers are the most highly-trained in the industry, and because they are paid for their time – not according to how many jobs they complete – they are motivated to take as long as it takes to make sure the work in your home is done correctly.

Moisture Loc is family operated and always has been. You can count on us to take good care of your family too.

Warranty: Moisture Loc's Basement Waterproofing solutions come with a lifetime warranty for the areas the solutions have been applied to. All mechanical or electrical devices come with a manufacturer's warranty.
